                                                                                                                The present invention describes a high-affinity monoclonal antibody characterised by an acid-washed enzyme-linked immunosorbent assay (EIA). The antibody is used in cancer therapy. Association of the new antibody with an antigen is favoured over dissociation in vivo and they therefore have longer localisation times at target sites, resulting in a higher concentration of antibodies localised at the target sites. Targeting the antibody to a site in vivo is improved. The concentration of antibody does not need to be too high which reduces side-effects and costs of therapy. The present sequence encodes the light chain variable region of a monoclonal antibody having affinity for carcinoembryonic antigen (CEA, a tumour associated antigen), which is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Carcinoembryonic antigen; CEA; sheep; monoclonal antibody; tumour associated antigen; anti-carcinogenic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Carcinoembryonic antigen affinity antibody light chain variable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and thempay, drug screening, and thrombolytic activity, cancer diagnosis and thempay, drug screening, and serve for the containing the server of the server of the containing the containing the containing the server of the containing the

These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atheroscierosis, myasthenia gravis, osteoarthritis, rheumatoid arthritis, scleroderma, systemic lupus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc polypeptide (II) sequences. (I) is useful as hybridisation probes, cc polymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The cc and gene mapping, and in recombinant production of (II). The cc polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or cc quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical cmaging of sites expressing (II). (I) and (II) are useful in medical company of sites expressing (II). (I) and (II) are useful for treating cc disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations company in the polypeptide other types of data and products dependent on DNA and call amino acid sequences. AAS64197-AAS94564 represent novel human cc antino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content of the product of the printed of the product of the company in the printed content of the printed of the pri

The resulting transgene was used in the production of transgenic mice in which the proportion of spleen celwhich are mature B cells is not more than a quarter of that in wild-type animals. The animals are more susceptible to infectious diseases than the wild-type and are models for severe B cell deficiency. See also AAQ22489 for the transgene sequence.
                                                                                                                                                                                                                                                                                                                                                                                                            101

The lambda-E-mu construct was prepared by cutting the lambda construct at the HindIII site 0.9kb downstream of C(lambda)2. The fragment was blunt-ended and ligated to a 995bp XbaI fragment of pTAR-7 containing the mouse Ig heavy chain enhancer. The transgene construct was used to transfect mouse cells for the production of B cell deficient transgenic mice. The mice can be used to study e.g. X-linked agammaglobulinemia.

The clone containing the active lambda gene was identified by probing the library with a radiolabelled BanHI fragment of the human lambda gene. (The complete sequence of U266-lambda gene has EMBL Acc.#
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (HARD ) HARVARD COLLEGE

The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antipodies can be used as a cell or tissue sample. The antibodies can be used as a cell or tissue sample. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodie for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        whole adipocytes is used in the treatment of obesity and obesity related diseases - ^{ullet}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 alignment_block:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                alignment_scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel fusion protein (I) that has, at its CC N-terminus, one or more epitopes that bind specifically to autoantibodies CC (AAb) against the islet cell antigen IA2 and, at its C-terminus, one or CC more epitopes that bind specifically to antibodies (Ab) directed against the glutamate decarboxylase GAD65. (I), also nucleic acid (II) encoding CC it, vectors containing (II) and transformed cells, are useful for CC diagnosis and prognosis of diabetes mellitus type 1, stiff-man syndrome, CC polyglandular autoimmune syndrome or other autoimmune conditions CC associated with Aab against GAD65 or IA2. (I) provides a rapid and simple CC diagnosis of high specificity and sensitivity, capable of recognizing CC antibodies against both IA2 and GAD65, simultaneously. Unlike known CC fusions, where the GAD65 component is at the N-terminus, (I) contains CC correctly folded conformational epitopes that can react with most MICA CC autoantibodies. This sequence encodes the human autoantibody MICA-6 variable region heavy chain used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-09-786-015-4 x AAI68765

Included in the invention are polynucleotide sequences AAC96948 - AAC96955 which encode fragments of the heavy and light chains of the antibody. Proteins and peptides represented by sequences AAB52185 - AAB52210 are fragments of the anti-hepatitis B light and heavy chains. Also included in the invention are PCR primers AAC96975 - AAC96977 which are used in the construction of the antibody. The antibody exhibits antiinflammatory, and hepatotrophic activity, and can be used in a drug effective at preventing hepatitis B infection.

XX Mixture or panel of a prion concurrent sequence concurrent sequence condifferent specific binding member comprible decomposition of the present sequence condifferent specific binding member comprible decomposition of the sequence condifferent specific binding member comprible decomposition of the sequence condition o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC fragment. The fragment is used to produce a mixture or panel of 5 CC different specific binding members, each comprising an antibody VH CC and/or VL variable domain and capable, when displayed on the surface CC of filamentous bacteriophage particles or in the case of a specific CC binding member comprising the D5 VH and/or VL variable domain when CC bond to human serum amyloid protein, to pass through a mammallan CC blood brain barrier (BBB). The panel is useful for the selection of CC cross BBB, ability to bind endothelial cells or other brain cell antigen, CC ability to bind areas of inflammation in the brain or BBB breakdown or receptor. The antibodies are useful in diagnosis, prophylaxis and CC treatment of human or animal body, including neurological diseases, such as Alzheimer's disease, prion disease, AIDS-related dementia, epilepsy cand traumatic brain injury and any diseases involving inflammation coccurring within the brain or central nervous system.

```

The present sequence encodes a recombinant human antibody scFv. Antibody TN11 reacts with the long form of human Tenascin-C (TN-C). The epitope recognised by TN11 is located inside domain C of TN-C. TN11 is therefore only capable of recognising TN-C isoforms containing domain C (cTN-C). TN11 is useful for detecting the presence of TN-C isoforms in vitro or in vivo for diagnosing pathologies expressing the cTN-C isoforms of TN-C. It is useful for the preparation of formulations for the treatment of

are used as tumour-targetting molecules for diagnosis and treatment. The carbibodies can be attached to effector molecules. The effector molecules artibodies can be attached to effector molecules. The effector molecules can be attached to effector molecules. The effector molecules cytotoxins such as ricin, abrin or pseudomonas exotoxin; cradionuclides; ligands such as growth factors; therapeutic agents such as vinblastine, vindesine or melphalan; ribozymes; or antisense concludes. The antibodies may also be used for in vivo or in vitro detection and/or quantitation of the c-erb-2 receptor and thus diagnosis and/or localisation of cancers characterised by expression of c-erb-2. Although antibodies have previously been used to target tumour cells, their success has been limited. The utility of prior art antibodies has been hampered by the paucity of tumour specific antibodies, antibody immunogenicity, low binding affinity, and poor tumour penetration. CC tumour specific human antibodies were available. However, the production of human monoclonal antibodies using conventional hybridoma technology has proven difficult. Also, most of the antibodies produced react with cantibable for use as tumour-targetting molecules. The antibodies of the invention overcome these difficulties, as they are targetted to a cumour specific antigen, and avoid the problem of immunogenicity as they are targetted to a cumour specific antigen, and avoid the problem of immunogenicity as they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents cDNA encoding an internalising humanised antibody, scFv F5, which specifically binds to the extracellular domain of the c-erbB-2 receptor, the protein product of the HER/neu oncogene. The scFv F5 antibody binds to the epitope of the c-erbB-2 receptor that is bound by F5 antibodies. On binding the c-erbB-2 receptor, the antibody is transported into the cell. The c-erbB-2 receptor is a marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein which is overexpressed by 30-50% of breast carcinomas and other adenocarcinomas, and thus provides a useful cell surface marker for specifically targetting tumour cells. The antibodies of the invention
                                                      are human in origin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel internalizing antibodies used to treat cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Page 81;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          English

                                                                           Percent Similarity:
                                                                                                                                                                                           used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or determine the presence of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for different types of fat deposits can also be produced e.g. intra-abdominal fat associated with heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                          AAS03401-AAS03535 represent anti-adipocyte monoclonal antibody heavy and light chain coding sequences of the invention. ```

The present sequence encodes an antibody variable light chain (VL) fragment. The fragment is used to produce a mixture or panel of 5 different specific binding members, each comprising an antibody VH and/or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when

The panel is useful for the selection of specific binding members with a desired property such as ability to cross BBB, ability to bind endothelial cells or other brain cell antigen, ability to bind areas of inflammation in the brain or BBB breakdown or ability to bind intracellular adhesion molecules and to bind transferrin receptor. The antibodies are useful in diagnosis, prophylaxis and treatment of human or animal body, including neurological diseases, such as Alzheimer's disease, prion disease, AIDS-related dementia, epilepsy and traumatic brain injury and any diseases involving inflammation occurring within the brain or central nervous system.
